Loop Unrolling and Register Renaming

Loop Unrolling and Register Renaming

- To avoid **WAR** and **WAW** hazards:
- Tomasulo provides ***Implicit Register Renaming***
  - Register Renaming provided by Reservation Stations
- *Now we introduce:*
  - Compiler transformation called **Loop Unrolling** combined with ***Register Renaming*** *by using more* registers specified in the ISA

Tomasulo Loop Example: Code

```
Loop:   LD      F0   0    R1
        MULTD   F4   F0   F2
        SD      F4   0    R1
        SUBI    R1   R1   #8
        BNEZ    R1   Loop
```

5 instructions per iteration

- Let's consider a simple loop example
- Assume branch predicted as taken
- Are there any dependency?

Tomasulo Loop Example: Code

```
LD      F0   0    R1
MULTD   F4   F0   F2   # RAW F0
SD      F4   0    R1   # RAW F4
SUBI    R1   R1   #8
BNEZ    R1   Loop      # RAW R1; WAR R1
                       Pred. taken
```

Tomasulo Loop Example: Code

Let's consider the first two iterations:

```
LD      F0   0    R1
MULTD   F4   F0   F2   # RAW F0
SD      F4   0    R1   # RAW F4
SUBI    R1   R1   #8
BNEZ    R1   Loop      # RAW R1; WAR F1;
                       Pred. taken

LD      F0   0    R1   # WAW F0
MULTD   F4   F0   F2   # RAW F0 WAW F4
SD      F4   0    R1   # RAW F4
SUBI    R1   R1   #8
BNEZ    R1   Loop      # RAW R1; WAR R1;
                       Pred. taken
```

Tomasulo Loop Example: Code

```
Loop:   LD      F0   0    R1
        MULTD   F4   F0   F2
        SD      F4   0    R1
        SUBI    R1   R1   #8
        BNEZ    R1   Loop
```

5 instructions per iteration

- Assume branch predicted as taken
- ***We unroll the loop 4 times by using Register Renaming for F0 and F4 to avoid the WAW hazards among the iterations.***

Unrolled Loop (unrolling factor 4) + Reg. Renaming

```
1  Loop: LD     F0,0(R1)
2        MULTD  F4,F0,F2
3        SD     F4, 0(R1)
4        LD     F6,-8(R1)
5        MULTD  F8,F6,F2
6        SD     F8,-8(R1)
7        LD     F10,-16(R1)
8        MULTD  F12,F10,F2
9        SD     F12,-16(R1)
10       LD     F14,-24(R1)
11       MULTD  F16,F14,F2
12       SD     F16,-24(R1)
13       SUBI   R1,R1,#32
14       BNEZ   R1,LOOP
```

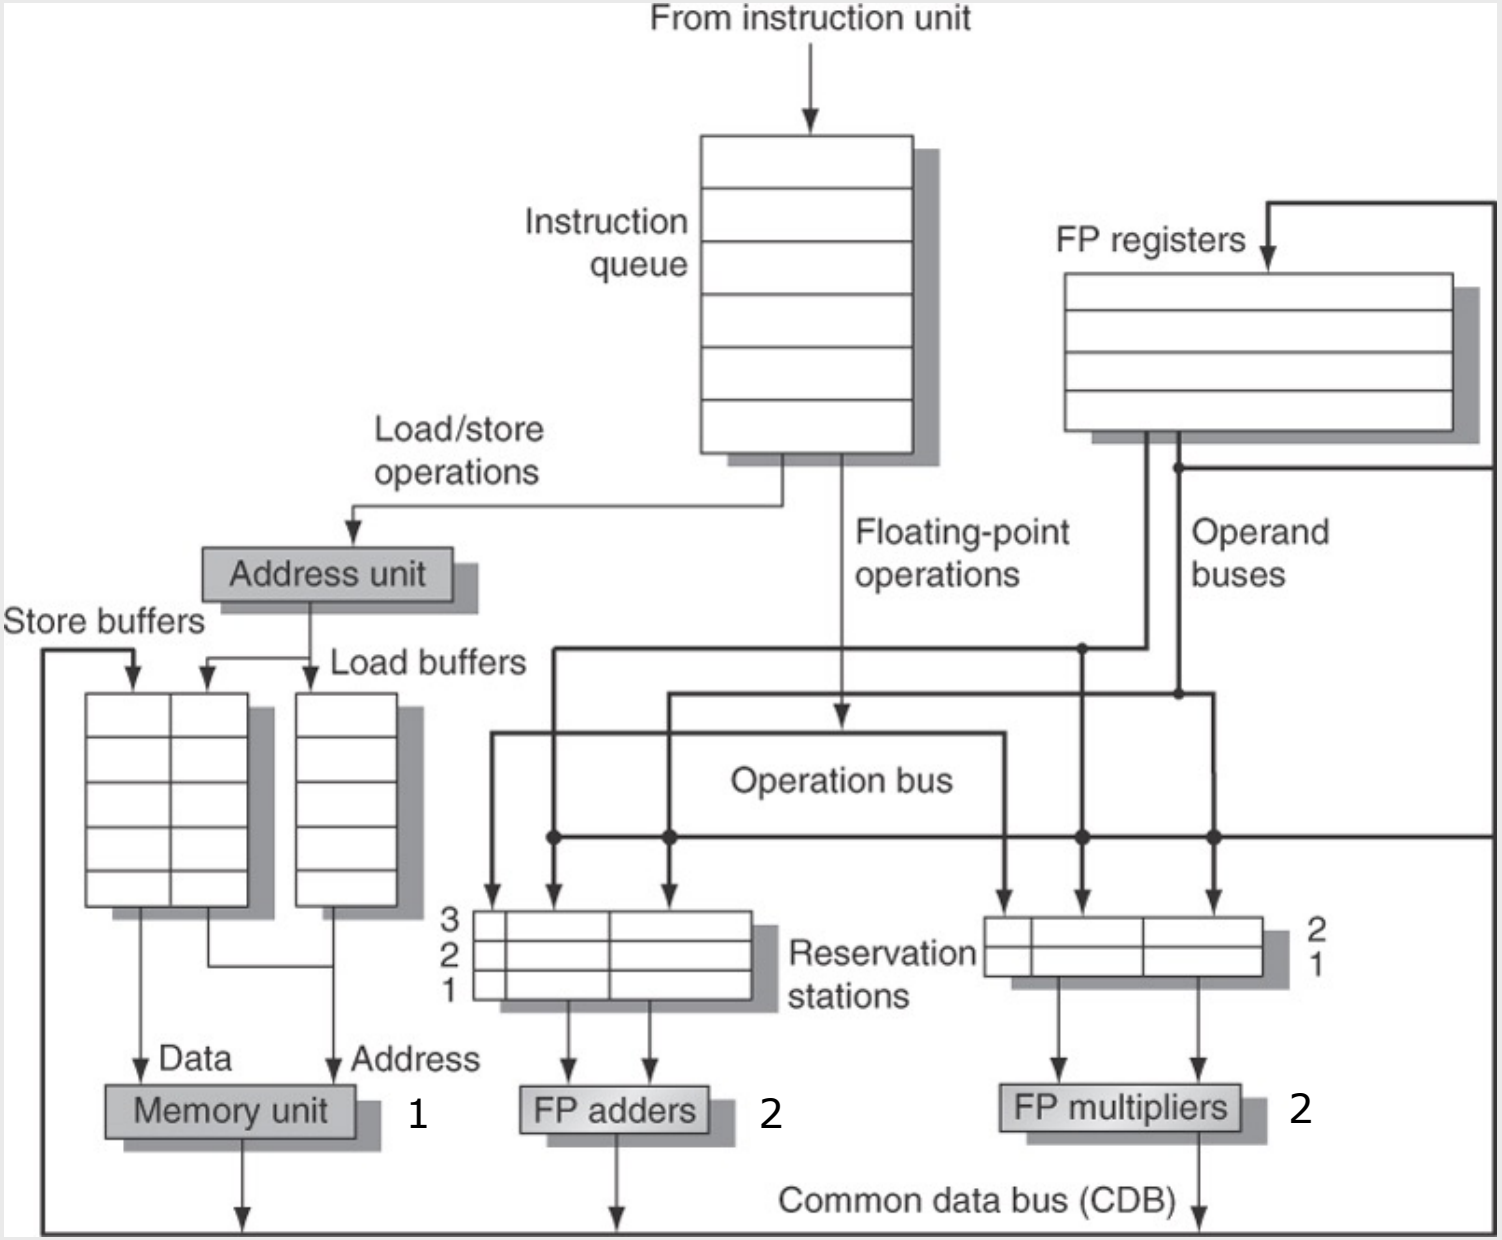
More instructions (14) per 4 iterations => 3.5 instr. per iteration
Used more FP registers in the unrolled loop code!

Unrolled Loop (unrolling factor 4) + Reg. Renaming + Code Rescheduling to minimize RAW stalls

```
1  Loop: LD     F0,0(R1)
2        LD     F6,-8(R1)
3        LD     F10,-16(R1)
4        LD     F14,-24(R1)
5        MULTD  F4,F0,F2
6        MULTD  F8,F6,F2
7        MULTD  F12,F10,F2
8        MULTD  F16,F14,F2
9        SD     F4, 0(R1)
10       SD     F8, -8(R1)
11       SD     F12,-16(R1)
12       SUBI   R1,R1,#32
13       BNEZ   R1,LOOP
14       SD F16, 8(R1) # branch delay slot (8-32 = -24)
```

Tomasulo and Implicit Register Renaming

Recap on Tomasulo Architecture



How can Tomasulo overlap iterations of loops?

- **Implicit register renaming provided by Reservation Stations** to buffer operands of instructions:
  - Replace register names from original code with *dynamic "pointers" to Reservation Stations*
    => to eliminate WAR and WAW hazards.
- Multiple loop iterations use different Reservation Stations for registers **=> dynamic loop unrolling** without changing the original code.
- Effectively increased the size of Register File by using Reservation Stations.
- **Crucial:** We need multiple FP units to issue multiple iterations **by using branch prediction!**
  - We enable instruction issue to advance past branch control flow operations.

Tomasulo Loop Example: Code

```
Loop:   LD      F0   0    R1
        MULTD   F4   F0   F2
        SD      F4   0    R1
        SUBI    R1   R1   #8
        BNEZ    R1   Loop
```

5 instructions per iteration

- Assume first load takes **8 clocks** (due to a cache miss), second load takes **1 clock** (hit)
- Assume FP multiply takes **4 clocks** latency
- Assume branch predicted as **taken**
- To be clear, we will show only clocks for SUBI, BNEZ

Tomasulo Loop Example: Code

Let's consider the first two iterations:

```
LD      F0   0    R1
MULTD   F4   F0   F2   # RAW F0
SD      F4   0    R1   # RAW F4
SUBI    R1   R1   #8
BNEZ    R1   Loop      # RAW R1; WAR F1;
                       Pred. taken

LD      F0   0    R1   # WAW F0
MULTD   F4   F0   F2   # RAW F0 WAW F4
SD      F4   0    R1   # RAW F4
SUBI    R1   R1   #8
BNEZ    R1   Loop      # RAW R1; WAR R1;
                       Pred. taken
```
